New Pneumatic Actuator DR/SC Series: FHP-052 to FHP-400

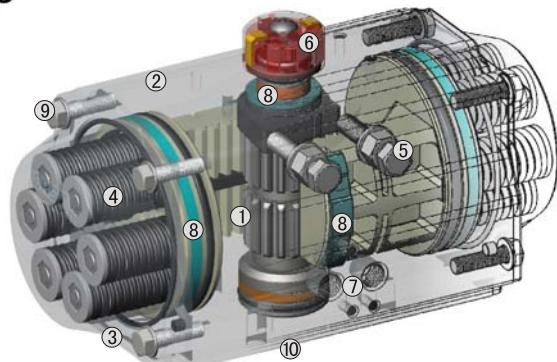

New Pneumatic Valve Actuator of Series DR/SC

The new DR/SC pneumatic actuator of rack and gear wheel type is manufactured by FLOWTECAL GROUP CO.LIMITED adopting the latest technique of the world. CAD based 3D model is also applied to optimize the design of the products and to make innovation on the design as well. the aspect of the product is modern, compact and good looking. Built with new materials and new process, the quality of the products could be guaranteed as well as the performance. Moreover more types of products are available to benefit customers. All the products are completely designed and manufactured in according to the latest international standard specification of technology to meet the requirement now and in future.

- ① the rack, gear wheel and the two pistons are designed in symmetric structure to perform stably and rapidly with high accuracy and high power output. the rotation in the inverse direction can be performed by simply changing the assembling location of the pistons.
- ② the extruded cylinder body is made of high quality stainless steel with fine machined socket and hard anodized outer surface(Teflon coat + anodisation would be provided at special occasion)to prolong the service life and lower the coefficient of friction.
- ③ One-piece design is adopted. All type of single acting actuators and double acting actuators are provided with same cylinder body and end cap. The acting module could be easily changed by installing or demounting springs.

- ④ Combined preload security group spring could be mounted or increased/decreased easily and safely during assembling or during in field usage
- ⑤ the two sole adjusting screws at the side surface of the actuator which has been already installed on the valve could make the adjustment of location of the valve opening and closing more convenient and accurate. The special adjusting screws which are much longer would be provided if full stroke adjustment is needed.
- ⑥ Multifunctional location indicator, in field visible indicator and standard socket in accordance to VDI/VDE3845、NAMUR could be installed and export all the accessories such as limit switch cabinet, electric localizer and position sensor(JEELON, P+F, Turck).

- ⑦ the air supply interface is built according to NUMAR criterion. To the interface the NUMAR solenoid valve can be installed directly.
- ⑧ the composite material made bearing shell at the back of the rack, the deflector ring of the pistons as well as the bearing shaft of the output shaft are provided with more lubrication to protect them against the metal-metal friction. Thus, a prolong service life and the low friction could be guaranteed.
- ⑨ All the fasteners are made of stainless steel to be resistant to corrosion for a long time.
- ⑩ the pontes are built in according to latest version of ISO5211,DIN3337(F03-F25) to guarantee the interchangeability and versatility of the products

Operating Principle of FHP Series Actuator

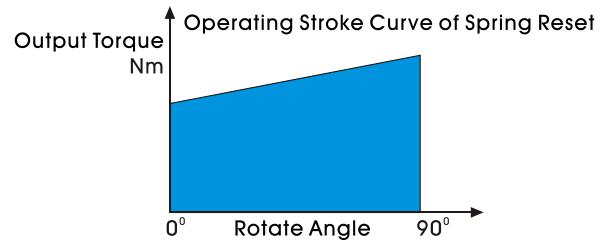

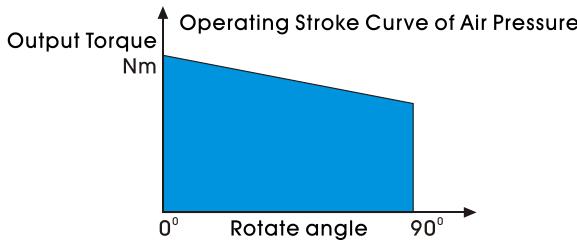

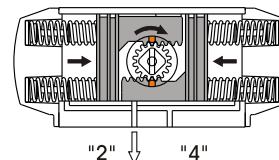

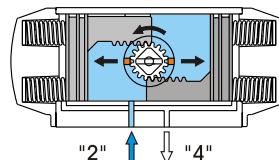

Operating Principle of DR(DL) Double Acting Type

The air source pressure comes into the cylinder body between the two pistons from air entrance (2) and pushes the pistons toward the end of the cylinder body. The air between the pistons and the ends of the cylinder body is released from air entrance (4). Meanwhile the racks of pistons rotate the output shaft anticlockwise (gear wheel) simultaneously, whereas if the air source pressure comes into the ends of the cylinder body from air entrance (4) and pushes the pistons toward each other with the air between two pistons released from air entrance (2), the output shaft (gear wheel) would be driven by the racks of the pistons simultaneously to rotate clockwise. (if the pistons are assembled in different direction from each other, the output shaft would turn out to rotate in inverse direction, namely the double acting reverse DL type)

Operating Principle of SC(SO) Single Acting Type

The air source pressure comes into the cylinder body between the two pistons from air entrance (2) and pushes the pistons toward the end of the cylinder body while the springs at each ends inside the cylinder body is forced to shrink with the air between the pistons and the ends of the cylinder body released from air entrance (4). In the meantime, the racks of pistons drive the output shaft (gear wheel) simultaneously to rotate anticlockwise. After the direction of the air source pressure is reversed by the solenoid valve, the springs at each end begin to reset and the pistons are forced toward each other by the elasticity with the air between two pistons released from air entrance (2). Meanwhile the output shaft (gear wheel) would be driven by the racks of the pistons simultaneously to rotate clockwise. (if the pistons are assembled in different direction from each other, the output shaft would turn out to rotate in inverse direction when the springs reset, namely the single acting reverse SO type)

FT

Pattern Selection of Actuator

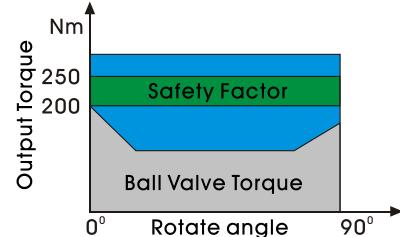

Pattern Selection of the Actuator

An increment should be added to the identified valve torque for safe when select the pattern of the pneumatic actuator. For vapor or non-lubricant liquor medium, the increment should be up to 25% of the valve torque, 30% for non-lubricant pasting liquor medium, 40% for non-lubricant dry air medium, 60% for non-lubricant particle medium delivered by air and 20% for lubricating clean medium with low friction respectively.(the safe increment above is recommended in theory for reference)

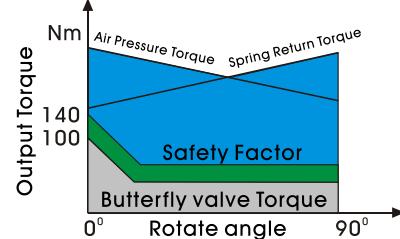

Sizing Example for Double-acting Actuator:

- * Published ball valve torque = 200 Nm
- * Operating medium = non-lubricated steam
- * Safety factor = $200 \text{ Nm} + 25\% = 250 \text{ Nm}$
- * Air supply pressure available = 5 bar
- * The double acting actuator that produces a minimum of 250 Nm at 5 bar is the DR00300 of 277 Nm according to the output torque table of the DR actuator.

Sizing of A Single-acting Actuator:

- * Published butterfly valve torque = 100Nm
- * Operating medium = non-lubricated dry air
- * Safety factor = $100\text{Nm} + 40\% = 140\text{Nm}$
- * Air supply pressure available = 4.5 bar
- * the spring return actuator selected is the SC00450 (9 springs) with a most similar ending torque of 148Nm at 4.5 bar according to the SC output torque table. (The relative balance of torques between air supply pressure and spring return should be noted)

(A) the acting time of the actuator be tested under following conditions:(1)normal temperature (2)90° stroke (3)caliber of the solenoid valve should be 4mm with the flow quantity of Qn400 L / min (4)inner diameter of the pipe should be 8mm (5) neutrally clean air (6)air source pressure of 5.5bar (7)actuator with no load
PS: the acting time would change as one or more variables change in field test.

(B) suppose every SC actuator weighs as 10 springs, the increase/decrease weight of the actuator could be calculated by calculating the increase/decrease number of springs.

Relevant Data About The Actuator

DR/SC 3-Position Pneumatic Actuator

0°-45°-90°/0°-90°-180°

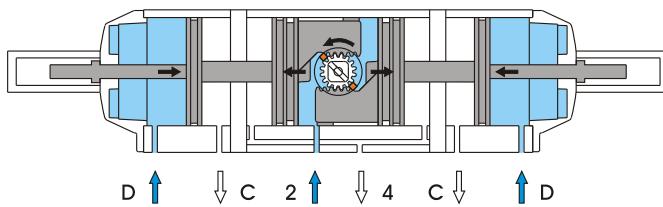

3-Position Pneumatic Actuator

Two types of 3-position pneumatic actuators can be provided, namely 0°-45°-90°type and 0°-90°-180°type respectively. After the air comes into the cylinder from the air entrance " 2 ", the pistons' movements toward the ends would be limited by the auxiliary pistons mechanism. Thus the pistons would stay in the middle position. The position of the mid position could be adjust to 20°,30°,50°,75°and 95°,120°,130°,150°,175°etc by using the adjusting screws at each end of the surface.

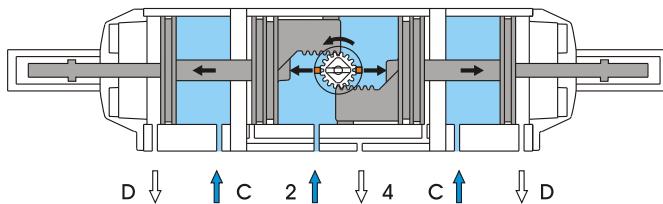

Operating Principles:

The control circuit with solenoid valve is designed to complete the operation of 3-position pneumatic actuator. The control principles are as followed.

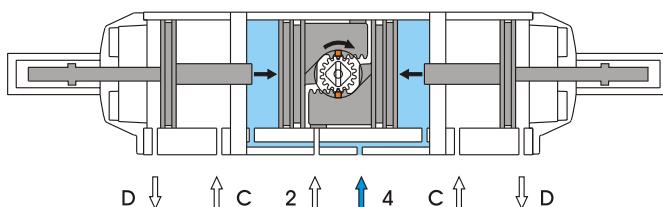

Position 1(mid position)

Air source pressure come into both entrance 2 and entrance D simultaneously and press out the air from entrance 4 and C. The inner pistons move along Entrance 2 while the inner pistons are limited in the mid position which is decided before by the auxiliary pistons mechanism through entrance D.

Position 2(complete open position)

Air source pressure come into both entrance 2 and entrance C simultaneously and press out the air from entrance 4 and D. The inner pistons in entrance 2 keeps moving while the lock of auxiliary pistons mechanism is released through entrance C and the inner pistons reach complete open position.

Position 3(complete close position)

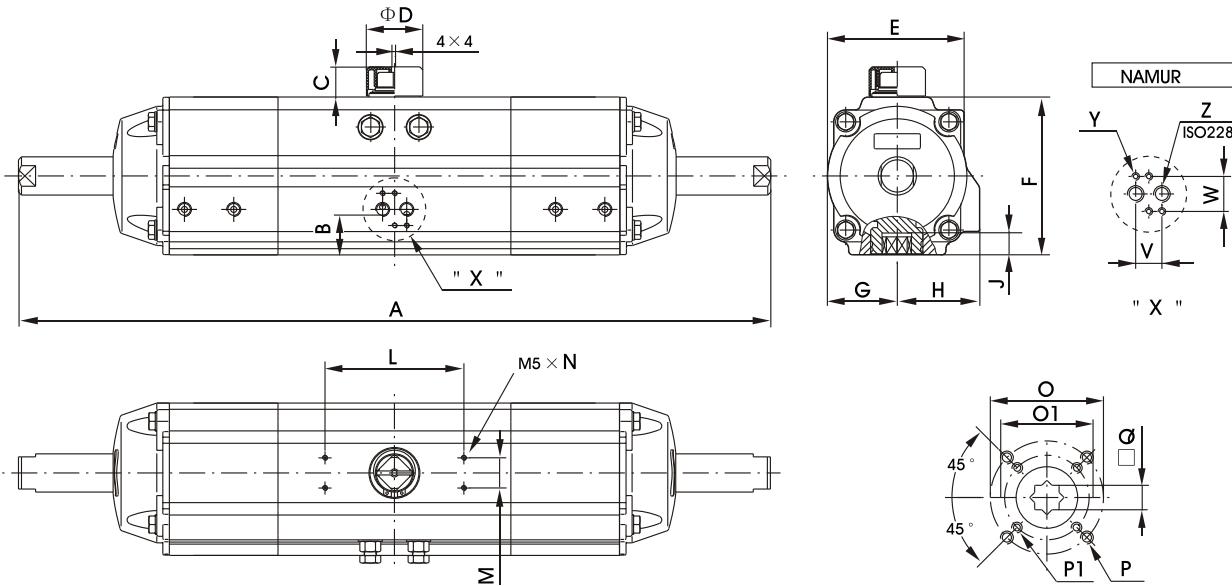

Air source pressure come into entrance 4 and press out the air from entrance 2. The inner pistons move toward midposition to reach complete close position. Springs with 3 different reset type, namely 0°-45°-90° are provided. When air supply or power supply are cut off (or when air source fails), the springs would force the inner pistons to move to the complete close position.

The darkened recommendation index under the air pressure torque are in accordance with the spring return torque data and the spring number.

FT

SC 0°-90°-180° Stroke Single Acting Actuator

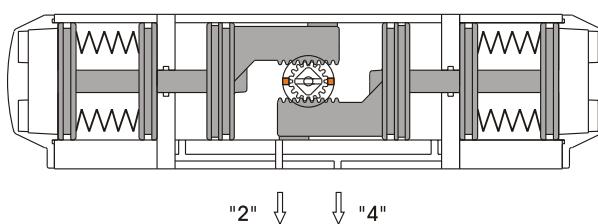

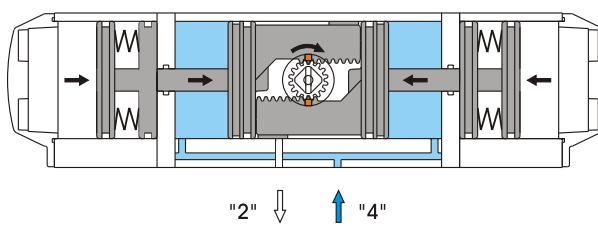

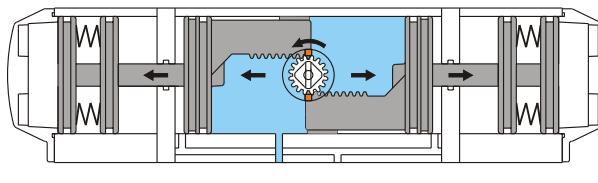

180° Stroke Single Acting Actuator (spring Reset)

Spring subassembly are provided at each end of 180° spring reset type pneumatic actuator which is suitable to act the back-and-forth movement among 0°-90°-180° and comes back to the position of 90° by spring resetting when air source pressure drops (or fails).

The 180° full-open position and the 0° shut-up position can be made for precious external adjustment at $\pm 4^\circ$ via standard methods.

Control Principle

From 90° to 180°

The air source pressure comes into the cylinder body between the two pistons from air entrance (2) and pushes the pistons toward the end of the cylinder body. The spring subassembly at each end is forced to shrink while the air between the pistons and the ends of the cylinder body is released from air entrance (4). Meanwhile the racks of pistons drive the output shaft (gear wheel) simultaneously to rotate anticlockwise to 180° .

From 90° to 0°

The air source pressure comes into the cylinder body between the two pistons from air entrance (4) and pushes the pistons toward each other. The spring subassembly at each end begins to reset while the air between the pistons is released from air entrance (2). Meanwhile the racks of pistons rotate the output shaft (gear wheel) clockwise simultaneously to 0°.

Air fail Operation

when the position is at 180°: when the air source pressure of entrance (2) is lost or the power supply of the solenoid valve is cut, the springs force the pistons to move toward the middle of the cylinder body which would rotate the output shaft clockwise to position of 90°

when the position is at 0°: when the air source pressure of entrance (4) is lost or the power supply of the solenoid valve is cut, the springs force the pistons to move toward the end of the cylinder body which would rotate the output shaft anticlockwise to position of 90°

FT

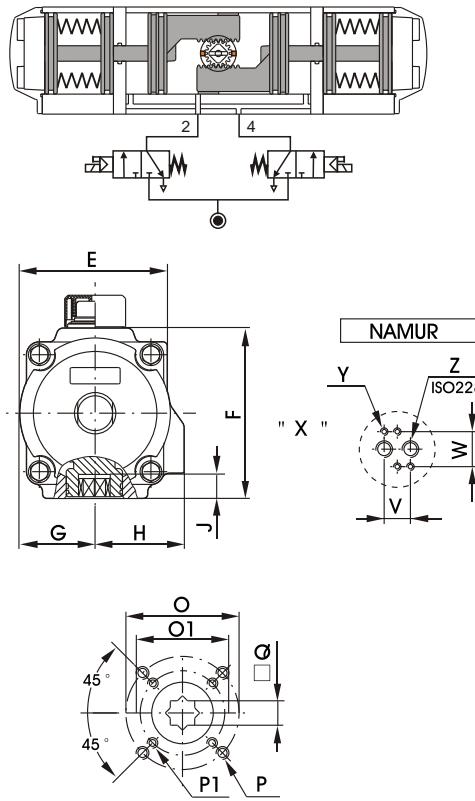

SC 0°-90°-180° Stroke Single Acting Actuator

Control Principle

In order to control the operation of the actuators 180° with 90° fail safe position , a system of solenoid valves controlling a sequence of air supplies to the actuator is required as described besides.

The actuator may be controlled by two 3 /2 way solenoid valves or by one 5/3 way solenoid valve.

Brief Introduction About The Company

Flowtecal Control Co. Ltd is the forecast specialist valves and controls manufacturing company in the world.

Flowtecal strategy is to be the low-cost, high quality maker and provider in each of its markets. Flowtecal supplies end users with a wide product range to meet modern industry flow control requirements in the following markets:
General industry
Chemical Oil & Gas
Pulp & Paper
Food & Pharmaceutical
HVAC & Water system
Petrochemical & Refining
Metals and Mining
Flowtecal can supply not only reliable products to ensure extended service life, but experienced technical support and unmatched after sales service.

All the valve manufacturers, aggregate unit manufacturers, valve franchisers, project contractors, designing institutes and ultimate customers desire to cooperate with the partner who can provide products of high quality. We hope all the customers can benefit from our professional technology, high quality products and our best service.
